PORTFOLIO PROJECT REPORT | FIELD ACTIVATION ANALYTICS

GlowRoot Naturals

Field Activation Performance

Where field effort goes, how long activities take, and how much of the logged work is actually finished across GlowRoot's Lagos retail outlets.

4,715	26.37 min	77%
Total Task Completed (dashboard KPI)	Average completion time	Average quality score

What this report covers

A management review of a field activation campaign: how logged activity is split across task types and outlets, how long promoters take to complete activities, and how much of the logged work is completed, overdue or still pending. It is built on the interactive Excel dashboard that accompanies this report.

> **Reading the numbers**
> Three totals appear throughout and measure different things: **6,498** task units (all statuses), **4,715** task units on completed records, and **1,506** activity records. Section 3 defines each one.

*Prepared by **Lawrence Ruth** | Portfolio analytics case study | 29 October 2026*

1. Executive Summary

The campaign is completing about three-quarters of its logged work, but effort is heavily concentrated in one activity, volumes differ widely between outlets, and a backlog of 376 records is overdue or pending.

6,498	1,506	75.0%
Task units logged	Activity records	Records completed

What the evidence shows

- **Sampling dominates.** 4,681 of 6,498 task units (about 72.0%) are samples distributed.
- **Outlet activity is uneven.** Justrite Yaba logged 671 task units and Ebeano Supermarket Lekki 665, against 116 at Shoprite Ikeja.
- **Completion is good, not complete.** 1,130 of 1,506 records (75.0%) are completed; 219 are overdue and 157 are pending.
- **Overdue is the priority.** Overdue records outnumber pending ones by 62, so more work has already missed its expected completion point than is still waiting.
- **Promoter averages vary.** The overall average is 26.37 minutes, with promoter averages from 21.39 to 33.33 minutes.

> **Management takeaway**
> Use the dashboard as a weekly operating review: confirm the sampling share matches campaign objectives, investigate outlet differences in context, and give every overdue activity an owner and a due date. High task volume alone is not evidence of sales impact or stronger promoter performance.

2. Business Problem

Field activation teams need to see where activity is happening, which tasks absorb effort, whether logged work gets closed, and whether execution varies by outlet, area or promoter. In a raw activity log of 1,506 rows, the patterns that matter for staffing and follow-up are hard to spot.

The dashboard was built to answer four questions:

- Which outlets record the largest and smallest task volumes?
- How is effort split across compliance checks, outlet visits, product demos, sales conversions and samples distributed?
- What share of logged activity is completed, overdue or pending?
- How do completion times and status patterns vary across promoters and areas?

3. Data and Metric Definitions

The source is a flat field activity log of **1,506 records across 9 columns**: Date, Promoter Name, Area, Outlet Name, Task Type, Tasks Completed, Completion Time (mins), Quality Score (%) and Status. The log was converted to an Excel Table and checked for blank rows, duplicate records, data types and inconsistent text before any analysis. Completion Time is held in minutes, so averages need no conversion.

Metric dictionary

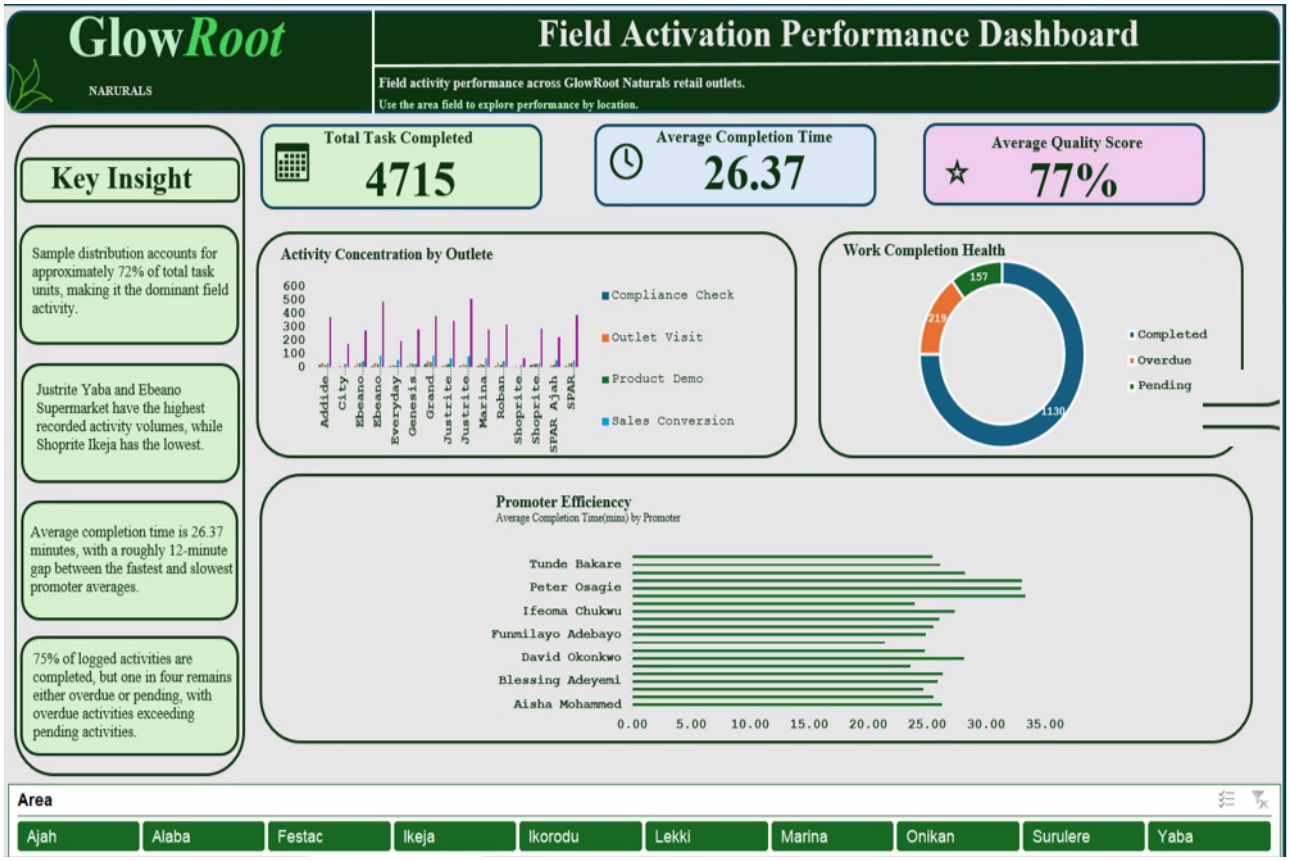

Measure	Value	Definition
Total Task Completed (KPI)	4,715	Sum of *Tasks Completed* on records with Status = Completed (SUMIF on Status)
Total task units	6,498	Sum of *Tasks Completed* across all records, whatever the status. Task-type and outlet pivots add up to this.
Activity records	1,506	Count of log rows. Status counts (completed, overdue, pending) are counts of records.
Samples Distributed	4,681	Task units of type Samples Distributed; about 72.0% of 6,498
Average completion time	26.37 min	Average of Completion Time (mins) across records
Average quality score	77%	Average of Quality Score (%) across records

Units are not records
6,498 and 4,715 count task *units*; 1,506 and 1,130 count *records*. A completed record can carry several units, which is why 4,715 units sit on 1,130 completed records. Quote each figure with its unit to avoid mixing them up.

Workflow

- **Organise:** PivotTables summarise task units by outlet and task type, record counts by status, and average completion time by promoter.
- **Compare:** outlet totals, task-type mix and the split of completed, overdue and pending records.
- **Visualise:** KPI cards, a clustered column chart, a doughnut, a promoter bar chart and an Area slicer on a single page.
- **Interpret:** separate what the data shows from why it happens. The dashboard points to where to look; it does not establish causes.

4. The Dashboard

Single-page management dashboard. The Area slicer (Ajah, Alaba, Festac, Ikeja, Ikorodu, Lekki, Marina, Onikan, Surulere, Yaba) filters every visual.

How to read it

Panel	What it answers
KPI row	Headline status: 4,715 total task completed, 26.37 minutes average completion time, 77% average quality score.
Activity Concentration by Outlet	Clustered columns by task type and outlet; samples distributed is the largest category.
Work Completion Health	Doughnut of 1,130 completed, 219 overdue and 157 pending records (1,506 in total).
Promoter Efficiency	Average completion time by promoter, to spot differences worth investigating.
Area slicer	Local status patterns, instead of relying only on campaign-wide totals.

Management use
Use this view to find exceptions and prompt follow-up. It is a screening tool, not a performance appraisal.

5. Key Findings

Finding 1: Samples dominate the task mix

Samples distributed account for 4,681 of 6,498 task units (about 72.0%). Sales conversion follows at 821, then outlet visits (434), product demos (353) and compliance checks (209). This is a prompt to check the mix against campaign goals; it is not evidence that sampling is working or failing.

Task type	Task units	Share of 6,498
Samples Distributed	4,681	72.0%
Sales Conversion	821	12.6%
Outlet Visit	434	6.7%
Product Demo	353	5.4%
Compliance Check	209	3.2%
Total	**6,498**	**100.0%**

Shares are rounded to one decimal place and may not sum exactly to 100.0%.

Finding 2: Outlet volume varies considerably

Justrite Yaba (671) and Ebeano Supermarket Lekki (665) lead; Shoprite Ikeja is lowest at 116. The gap could reflect customer traffic, activation duration, promoter allocation or outlet requirements. The available fields cannot say which.

Outlet	Compl.	Visit	Demo	Sales	Samples	Total
Addide Supermarket Yaba	21	33	24	32	383	493
City Mall Onikan	9	16	7	30	180	242
Ebeano Supermarket Ajah	15	36	32	46	283	412
Ebeano Supermarket Lekki	15	37	25	93	495	665
Everyday Market Alaba	11	20	12	57	203	303
Genesis Supermarket Surulere	14	36	29	31	289	399
Grand Square Ikeja	26	46	42	92	386	592
Justrite Surulere	16	21	26	68	352	483
Justrite Yaba	15	28	24	85	519	671
Marina Mall Waterfront	10	28	24	70	286	418
Roban Stores Festac	10	32	21	47	321	431
Shoprite Ikeja	5	16	7	20	68	116
Shoprite Lekki	21	29	27	38	296	411
SPAR Ajah	6	23	18	53	226	326
SPAR Ikorodu	15	33	35	59	394	536
Grand total	**209**	**434**	**353**	**821**	**4,681**	**6,498**

Task units by outlet and task type (Compl. = Compliance Check, Visit = Outlet Visit, Demo = Product Demo, Sales = Sales Conversion).

Finding 3: Three in four records are completed

1,130 of 1,506 records are completed (75.0%). The other 376 (25.0%) are outstanding: 219 overdue (14.5%) and 157 pending (10.4%). Overdue exceeds pending by 62 records, so recovering already-late work should come first.

Status	Records	Share	Operational reading
Completed	1,130	75.0%	Majority of logged activities are closed.
Overdue	219	14.5%	Largest outstanding group; triage and assign owners.
Pending	157	10.4%	Review due dates and confirm next actions.
Total	**1,506**	**100.0%**	**Record-level denominator.**

Finding 4: Area performance is not uniform

Yaba has the highest completion rate of the three areas shown here and Onikan the lowest. Lekki has the most overdue records of the three (34 of 235). These are selected examples from the slicer, not a ranking of every area.

Area	Completed	Overdue	Pending	Records	Completion rate
Yaba	185	25	21	231	80.1%
Lekki	177	34	24	235	75.3%
Onikan	39	5	9	53	73.6%

Finding 5: Promoter completion times vary

The overall average is 26.37 minutes, and promoter averages run from 21.39 to 33.33 minutes, a gap of nearly 12 minutes. Task mix, outlet conditions, workload and experience all affect timing, so compare like with like before reading this as a performance gap.

Finding 6: Quality is reported as an overall average only

The average quality score is 77% across all records. Quality has not been broken down by area or promoter in this report, so it cannot yet say where quality is strongest or weakest. The Area slicer can be used to add that cut.

6. Recommendations

1. Recover overdue work first. Review the 219 overdue records by owner, outlet, task type and age, and agree a completion or escalation date for each.

2. Triage pending work. Decide for each of the 157 pending records whether it should be completed, rescheduled or reassigned.

3. Validate the activity mix. Compare the 72.0% sampling share with the campaign plan, and look at how samples distributed relate to product demos and sales conversions.

4. Understand outlet differences before moving resources. Check operating hours, activation duration, staffing, footfall and task requirements to explain high and low volumes.

5. Compare promoters fairly. Review higher completion times alongside task type, outlet, workload and operating conditions.

6. Keep the metric dictionary with the dashboard. Section 3 defines each KPI and its unit. Update it whenever a formula or status definition changes.

7. Suggested Management Routine

A light weekly review turns the dashboard into an operating control instead of a passive report.

Cadence	Review action	Expected output
Weekly	Review overdue and pending records by outlet and owner.	Named owners, due dates and an escalation list.
Weekly	Check outlet activity and task-type mix against the campaign plan.	Exceptions for unusually high or low activity.
Monthly	Compare completion times using similar task types and workloads.	Fair coaching and process-improvement actions.
Before reporting	Validate KPI formulas, status definitions and aggregation levels.	Consistent, auditable management metrics.

8. Limitations

- The dashboard is descriptive. It shows concentration, status distribution and associations; it cannot explain why an outlet or promoter differs.
- The dataset has no customer traffic, task complexity, promoter experience, travel distance or sales outcome fields, so high task counts do not establish commercial effectiveness.
- Promoter completion times are reported as an overall average and a range, not as individual rankings.
- Area results in Finding 4 are three selected examples, not a full ranking of every area.
- Quality has not yet been analysed by area or promoter.

9. Conclusion

The dashboard gives GlowRoot's Trade Marketing team a practical way to monitor field execution. The clearest signals are the concentration of task units in sample distribution (about 72.0%), the wide spread in outlet volumes (116 to 671), and the 376 records that are overdue or pending, of which 219 are already late.

Its value is in the questions it prompts. Is the task mix aligned with the activation objective? What explains the gap between outlets? Which overdue records need action this week? Built into a weekly routine, those questions move management from spotting exceptions to resolving them.
